CARD OFFER SAVINGS ASSISTANT

Product Concept & Working Documentation

Core idea: Users already own multiple credit/debit cards. The app tells them where, when, and how they can save money using the cards they already have — before they make a purchase.

1. The Problem

Many households have several credit and debit cards. The user may have cards from ICICI, SBI, HDFC, Axis, Canara and other banks, while a spouse may have another set of cards. The problem is not a lack of offers — it is that users do not know which of their cards has an offer at the right time.

Before buying something, users often manually check offers on Amazon, Flipkart, Zepto, Zomato, Myntra, BookMyShow and other merchant apps. This takes time and can cause users to miss limited-time offers, seats, quotas or booking opportunities.

Real-life example: A user wants to watch a movie on Friday. Their ICICI card has a Buy 1 Get 1 offer, but the offer is valid only on Saturday and Sunday. If the user knew this in advance, they could plan the movie for Sunday instead of checking at checkout or missing the opportunity.

2. The Solution

Build a personal savings assistant where a user registers the cards they already own. The system monitors and organizes relevant merchant and bank offers, checks the user's card eligibility against the offer rules, and presents the applicable offers in one place.

The product is not primarily about selling or recommending new credit cards. It is about helping users get more value from cards they already have.

3. Simple Product Promise

“Tell me what I can save with the cards I already own.”

Alternative positioning: Never miss a card offer again.

4. How the App Works

Step	User / System Action
1	User creates an account.
2	User adds cards using safe non-sensitive information such as bank and card type/variant.
3	User can optionally create a family/household card wallet with a spouse's cards.
4	System collects and maintains current offers from banks, merchants and approved data/API sources.
5	Eligibility engine compares each offer against the user's registered card and the offer conditions.
6	App shows eligible offers by category and date.
7	App sends notifications for useful or time-sensitive offers.
8	User goes directly to the merchant app/site and pays with the eligible card.

5. Main Categories

Category	Example use case
🎬 Movies	BookMyShow, cinemas and movie-ticket platforms
🍽️ Dining	Zomato, Swiggy and participating restaurants
🛍️ Shopping	Amazon, Flipkart, Myntra and other e-commerce
🛒 Grocery	Zepto and other grocery/quick-commerce platforms
🏨 Hotels	Hotel booking platforms and hotel offers
✈️ Travel	Flights, hotels and travel platforms

6. Example: Movie Offer Notification

🎬 Weekend movie offer
Your ICICI credit card is eligible for a Buy 1 Get 1 movie offer.
Valid: Saturday & Sunday
Platform: BookMyShow
Potential saving: Up to the applicable offer limit

Why this matters: The user receives the information before deciding when to go, rather than discovering the offer after reaching checkout.

7. Example: Multiple Cards, One Purchase

Suppose a user has SBI, ICICI, HDFC and Axis cards and wants to spend ₹5,000 on an eligible purchase.

Card	Applicable offer	Illustrative saving
SBI	10% discount	₹500
ICICI	5% discount	₹250
HDFC	₹150 instant discount	₹150
Axis	No applicable offer	₹0

Important product behavior: The app should clearly show the offer conditions and should not promise savings unless the user meets the applicable rules.

8. Family / Household Wallet

A potentially valuable feature is allowing two partners to combine their eligible cards into a private household wallet. For example, one person may have SBI and ICICI cards while the spouse has Canara and ICICI cards. The system can identify that an eligible card exists somewhere in the household.

Example: “Your family has an eligible ICICI card for this movie offer.” The user can then decide whose card to use, subject to the offer's terms.

9. Core Features

Feature	Purpose
Card Wallet	Store bank + card type/variant safely; avoid storing card number, CVV or OTP.
Offer Dashboard	Show eligible offers grouped by Movies, Dining, Shopping, Grocery, Hotels and Travel.
Eligibility Engine	Determine whether a registered card matches an offer's conditions.
Date/Time Awareness	Show when an offer is valid and surface upcoming weekend/limited-time offers.
Smart Notifications	Notify users about relevant, upcoming or expiring offers.
Merchant Link	Send the user to the relevant merchant/app to complete the purchase.
Best Saving View	Where rules permit comparison, show the available card/offer that provides the greatest applicable sa
Family Wallet	Allow a household to manage eligible cards together, with explicit consent.

10. Offer Eligibility Engine — The Core Technology

The key technology is not simply an offers database. The system must understand the rules behind each offer and compare those rules with the user's registered card and the relevant purchase context.

Potential offer-rule fields:

• Bank / issuer

• Card network and card variant

• Eligible BIN or card range, where applicable

• Merchant / platform

• Category

• Minimum transaction amount

• Maximum discount

• Valid date range

• Valid days of week

• Valid time windows

• Usage frequency / quota

• Eligible transaction type

• Other merchant or bank conditions

11. High-Level System Architecture

Mobile App → User accounts, card wallet, categories, notifications, offer details
↓

Backend → User service + offer service + eligibility engine + notification service
↓
Offer Data Layer → Bank/merchant sources, approved APIs, manually verified offers, update/expiry process
↓
Recommendation Layer → Relevance, saving value, date/expiry urgency and user preferences

12. MVP — Start Small

The original product documentation proposed an MVP focused on ICICI + SBI, Movies and BookMyShow, with a manually maintained offer database, basic recommendation logic and push notifications. This is a sensible way to validate the problem before expanding to every merchant category.

MVP component	Initial scope
Banks	ICICI + SBI
Category	Movies
Merchant/platform	BookMyShow
Card input	Bank + card type/variant; no sensitive card credentials
Offer source	Manually verified offer database initially
Output	Eligible offers + validity dates + key conditions
Notifications	Upcoming weekend / expiry notifications

13. Expansion Roadmap

Phase 1: Movies — BookMyShow — ICICI/SBI

Phase 2: Add HDFC, Axis, Canara and more banks; add Dining and Shopping.

Phase 3: Grocery, Hotels and Travel; broader merchant coverage.

Phase 4: Approved API/data partnerships, automated offer updates and stronger eligibility matching.

Future: AI-based behavior learning, optional SMS/email parsing with explicit user consent, UPI/merchant integrations and voice assistant capabilities.

14. Business Model

Potential revenue models from the original concept include affiliate commissions, sponsored offers, bank partnerships and a premium subscription for advanced insights. These should be evaluated only after the core user value and offer accuracy are validated.

15. Privacy & Security Principles

The product should follow a data-minimization approach. The original concept specifically proposes not storing card numbers, CVV or OTP, and instead storing only non-sensitive card information such as bank name and card type. filecite turn0file0 L235-L244

Any optional email/SMS parsing or family-card sharing should require clear user consent and should be designed with strong privacy controls.

16. Competitive Positioning

The market already contains card-offer discovery features, including card-specific offers inside merchant and financial apps. The product should therefore not be positioned merely as another “credit-card offers” directory.

Proposed positioning: A personal savings assistant that tells users which offers they are eligible for across the cards they already own, including when the offer becomes available.

17. Success Metrics

Metric	What it measures
Active users	People returning to check/use available savings.
Offer notification open rate	Whether alerts are useful.
Offer click-through	Users proceeding to merchant.
Offer redemption	Whether users actually use the offer.
Average savings per user	Estimated/verified value delivered.
Missed-offer reduction	Whether timely notifications reduce manual searching.

18. One-Line Pitch

“You already have the cards. We tell you where and when to use them to save money.”

Vision: Become the default assistant that helps people spend smarter by automatically finding the benefits they already have across their cards.

Document purpose: working product documentation for concept development. This document records the concept explained by the user and the earlier product notes; it is not a claim that the concept is legally novel or that competitors do not have overlapping features.
